## ABSTRACT:

PROBLEM TO BE SOLVED: To easily generate and correct a classification rule by classifying various kinds of and large quantity of electronic mails without requiring special knowledge about a classification rule format concerning the classification of a transmission/reception mail in an electronic main system.

SOLUTION: The classification rule for classifying the transmitted/received mail is stored in a rule storing means 2. When a mail transmitting/receiving means 1 transmits and receives the electronic mail, a mail classifying means 3 decides the classification categories of the respective mails through the use of the classification rule and stores it in a mail storing means 4. A classification result display means 5 displays the mail stored in the mail storing means 4 in an input/output device 7 by classification category. When a user designates the mail to be changed in classification, a classification rule generating means 6 picks-up the list of information to be the candidate of a classification condition from the contents of the designated mail and presents it to the user. When the user selects the classification condition from the list, the classification rule generating means 6 generates the classification rule.
